

TRANSPORT SYSTEM FOR PORTABLE AUGER

Abstract of the Disclosure

5 A transport system is provided for a portable auger. The transport system comprises a dedicated powered drive unit to provide powered-assisted, wheel movement of the auger by an individual. Means are provided for allowing the wheel, or wheels, driven by the dedicated power drive unit to freewheel when the dedicated power drive unit is not in use. Optionally, when the dedicated power drive unit is not in use, separate means may also be provided for locking the output shaft of the dedicated powered drive unit.
